License file

It is provided by Collaboard. It needs to be mounted to the following containers:

- cb_api
- cb_realtime
- cb_auth
- cb_licensing
- cb_mftapi
- cb_copyworker
- cb_worker1
- cb_worker2
- cb_canvasshotter
- cb_fileconverter
- cb_imageresizer
- mft_chunkservice
- mft_cleanerservice
- mft_mergeservice
- mft_storageoperationsservice

Easiest way is to have this file in your folder with overrides (appsettings.Override.json etc.). Filename can be changed, but it needs to be reflected in the SQL_SCRIPT_FILE.

Additional SQL scripts

There are two additional scripts required to correctly initialize Licensing that need to be run in correct order once. Files can be appended to the content of ConfigurationMigration.sql file as they contain the exists check, making sure they are applied only once.

Both scripts are part of the Distribution repository in respective "*/sql" folder.

1 - Initialize licensing.sql

File initialized products and other tables.

2 - SelfHostedUser.sql

File creates user with SysAdmin and LicensingManager roles. Make sure you specify correct USERNAME, EMAIL and optionally external authentication provider before applying this script. If you don't specify an external authentication provider, application user with default password will be created.

Default password: `3AFqYFr@CB`
